

I have heard so much talk about bootstrap over the years but have never really gotten into it. Not knowing what it was for such a long time never really bothered me, until I realised how simple it was and that it wasn't really anything extra, just a predefined framework that makes websites responsive. Learning it wasn't that difficult but finding the theme I wanted to use was the tricky part, then trying to work the theme into my already finished website was a challenge. All in all I think my website looks better with bootstrap, I was able to find a bootstrap theme off of w3 schools, I looked all over for a theme that was to my liking and finally decided on the one I have now. The webpage is fully functional through google chrome and it currently posted on the lamp server. The most challenging thing for me was getting the table on my Not Home tab to work, that took forever!
