I used NotePad++ with an FTP plugin to access my server, I like Npp because of its barebones design and I am used to it. I used a website called https://www.browserling.com/ to test a Chrome, Firefox, and Internet Explorer in the latest 2 versions of each. The thing that took the most of my time was relearning HTMl as a whole, hours and hours of research and testing different techniques. I had never used a table in HTML before so that was one of the things that took majority of my time, not only that but the table that I chose was difficult to put together because I chose the Periodic Table in order to test some revealing tricks. I incorporated a poll on the "Not Home" page that asks whether the user prefers one way or the other. I enjoyed relearning all of these techniques again and incorporating them all into my new website.
